REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance: the claims are allowable over prior art of record, because none of the references in alone or in combination discloses:

+++ A switching element comprising:

- a first actuator enabled for physical movement to selectively manipulate movement of a fluid within a gap; and
- a first optical waveguide and a second optical waveguide that intersect said gap such that optical communication from said first waveguide to said second waveguide is determined by a presence of said fluid within said gap, said fluid being selectively manipulated in response to said physical movement of said first actuator, as claims in claim 1.

+++ An optical switch comprising:

- a first light-transmitting waveguide and a second light-transmitting waveguide having ends at an intersecting region, wherein optical transmission between said first and second waveguides is determined by a presence of a fluid within said intersecting region, said intersecting region being a portion of a trench having a plurality of surfaces for accommodating said fluid; and
- a first electrically movable member in operative communication with said intersecting region via said fluid, said first electrically movable

member being configured to move between a plurality of predetermined orientations for displacing said fluid relative to said intersecting region, as
discloses in claim 14.

+++ A method for manipulating optical communication in an optical switch comprising:

- providing an input waveguide and an output waveguide;
- providing a trench at an intersecting gap of said input and output waveguides;
- receiving an optical signal at said input waveguide;
- enabling a piezoelectric actuator to switch between a plurality of configurations for displacing a fluid within said intersecting gap such that said optical communication from said input waveguide to said output waveguide is dependent upon a presence of said fluid within said intersecting gap; and
- transmitting said optical signal from said input waveguide to said output waveguide, as claims in claim 22.

+++ A method for operating an optical switch comprising:

piezoelectrically actuating a first membrane to manipulate a change in volume of a fluid container such that a fluid disposed within said

Art Unit: 2874

fluid container moves between a coupling position in which light from a first waveguide is received by a second waveguide and a noncoupling position in which light from a first waveguide is not received by said second waveguide. The underline limitations are critically, since the optical switching is significant improvement, the power requirements for switching is low, very little heat is dissipated to the surrounding structure, and thermal crosstalk among switches is reduced.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
